

## Assignment 1 - Node Modules, Express, MongoDB and REST API

### Instructions

In this assignment you will continue the exploration of Node modules, Express, MongoDB and the REST API.

### Assignment Overview

At the end of this assignment, you should have completed the following tasks to update the server:

- Applied MVC pattern
- Created a Node module using Express router to support the routes for the dishes REST API.
- Created a Node module using Express router to support the routes for quizzes and questions REST API.
- Created mongoose model
- Connected with MongoDB

### Assignment Requirements

+ A simple quiz is an interactive application designed to test users' knowledge on a particular topic or subject. It typically consists of a series of questions with multiple-choice options. Users select their answers and at the end of the quiz, the app displays the user's score and often offers a review of the questions and their correct answers.

+ Build your backend project that manages quiz and questions for a simple quiz app. The app allows users to implement the REST API (GET, POST, PUT, DELETE) endpoints /quizzes, / quizzes/:quizId and /question, /question/:questionId to interact with the MongoDB database namely SimpleQuiz.

+ Student can write the code based on the specific tasks

1. Create the schemas basing on the all requirements as below

Quiz: Represents a quiz or a test.

- Object\_id: Unique identifier for the quiz.

- title: Title or name of the quiz.
- description: Description or instructions for the quiz.
- questions: An array of question IDs associated with the quiz.

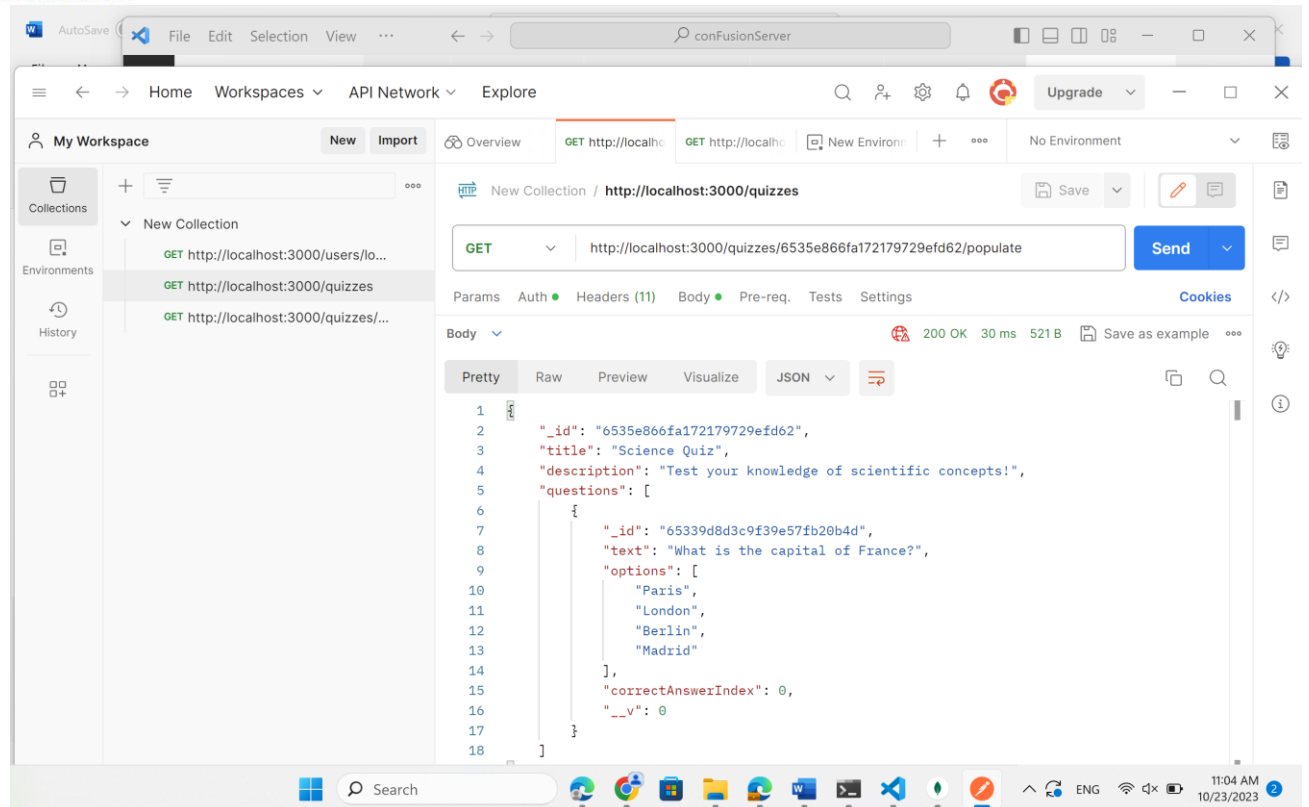

**Question: Represents a single question in the quiz.**

- Object\_id: Unique identifier for the question.
- text: The text of the question.
- options: An array of answer options for the question.
- keywords: An array of keywords for the question.
- correctAnswerIndex: Index of the correct answer within the options array.

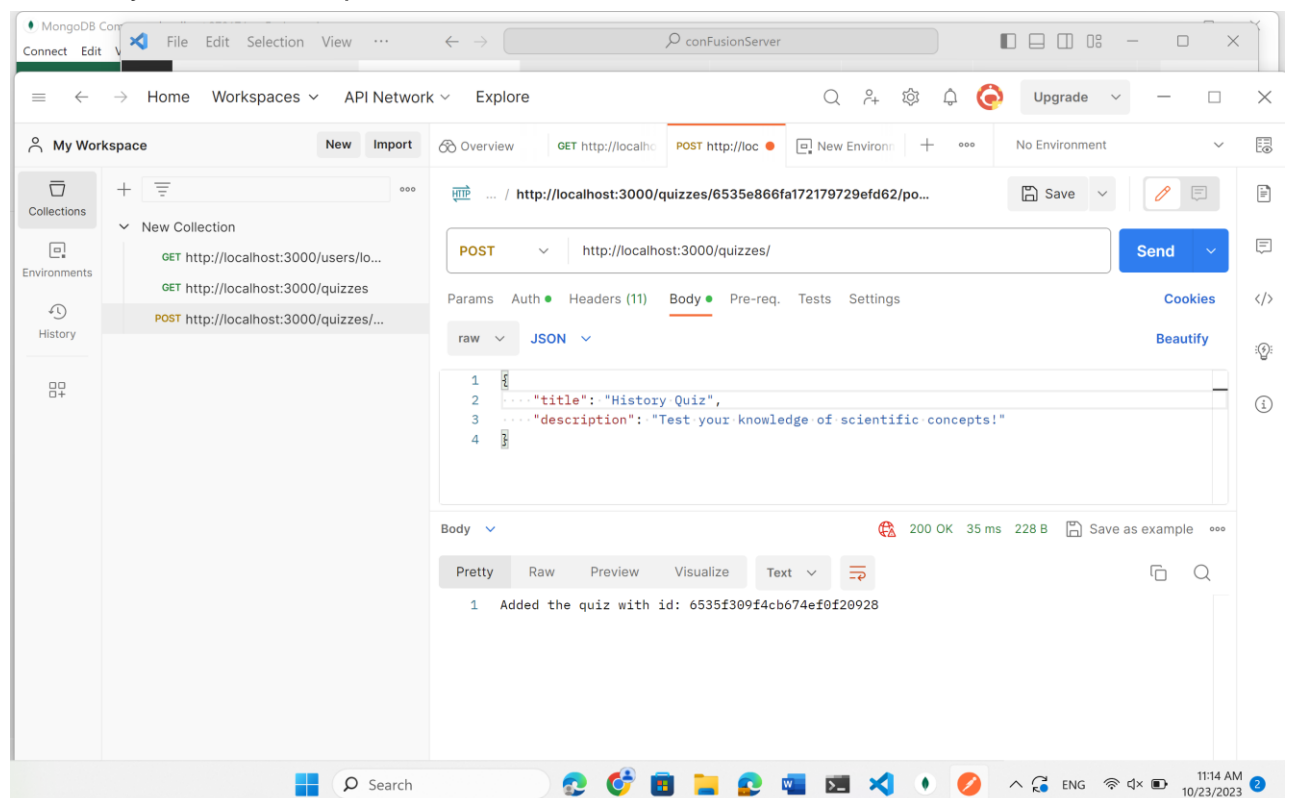

**2. Do the REST API (GET, POST, PUT, DELETE) endpoints /quizzes, /quizzes/:quizId and /question, /question/:questionId are implemented to interact with the MongoDB database namely SimpleQuiz**

Note: using Mongoose populate in order to display all questions in quiz when do endpoint /quizzes

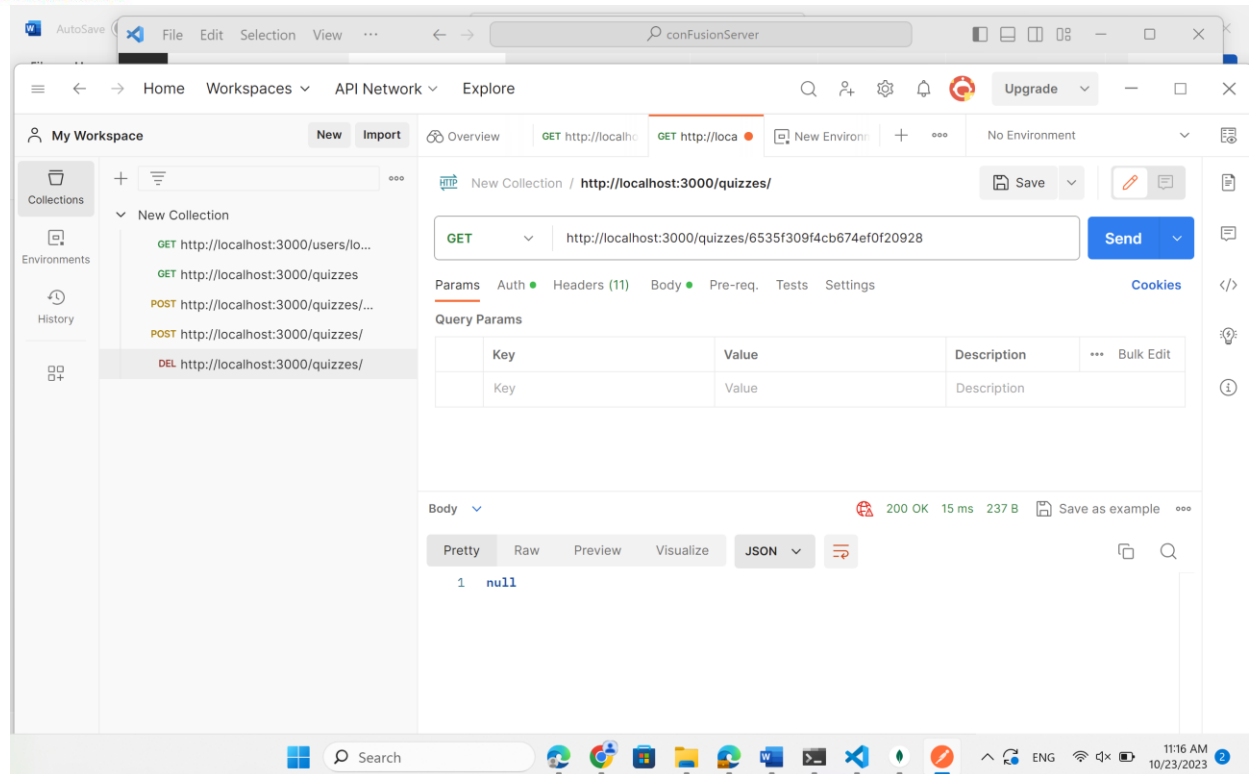

route GET/quizzes

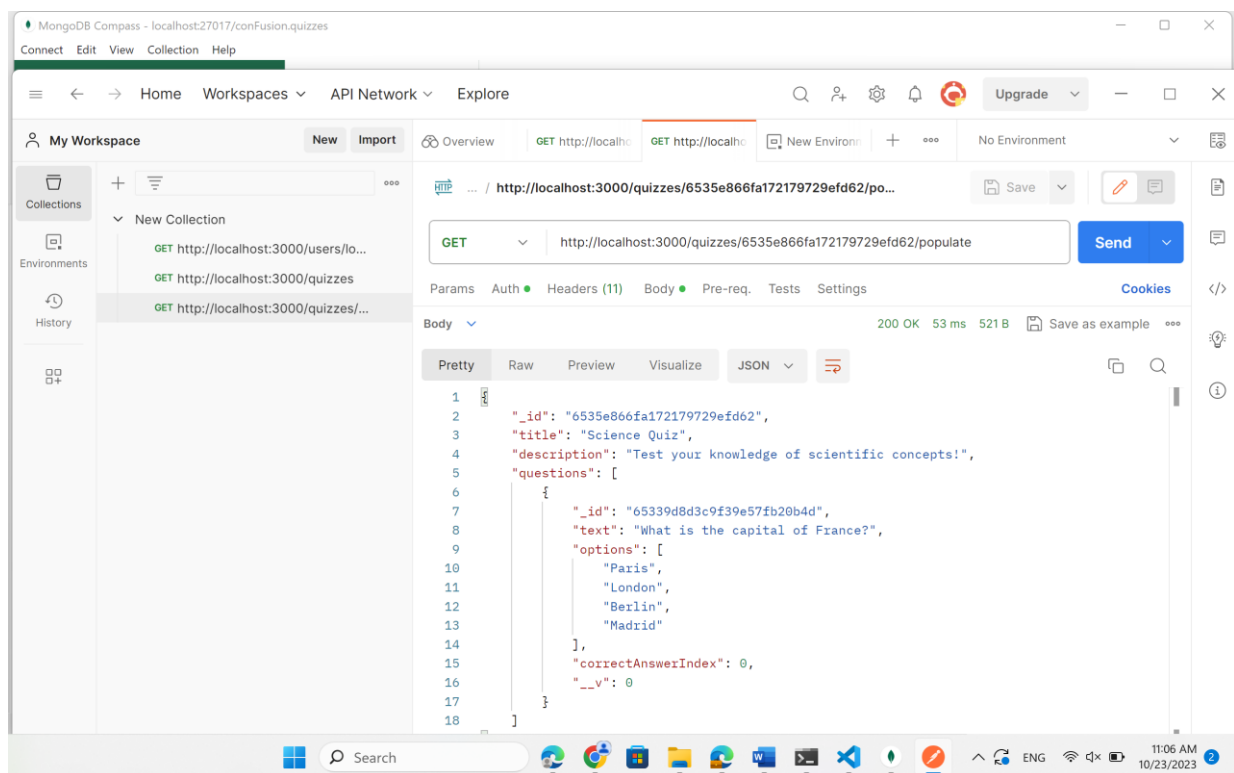

Run chạy route POST/questions

Run chạy route DELETE/quizzes/:id

3. Do the REST API (GET) endpoints /quizzes/:quizId/populate to match all questions with the word "capital"

4. Do the REST API (POST) endpoints `/quizzes/:quizId/question` to create new question in quizId

The screenshot shows a REST client interface with a POST request to `https://localhost:3443/quizzes/65ee9f0c9eb6744aa7fbc604/question`. The request body is a JSON object with a text question and four options. The response is a JSON object indicating the question was created successfully, including a correct answer index, an ID, and a version number.

**Request:**

```

1  {
2    "text": "What is the capital of France?",
3    "options": [
4      "Paris",
5      "London",
6      "Berlin",
7      "Madrid"
8    ]
9  },

```

**Response:**

```

4    "Paris",
5    "London",
6    "Berlin",
7    "Madrid"
8  ],
9    "correctAnswerIndex": 0,
10   "_id": "663b47be5b66547571a7568b",
11   "__v": 0
12 }

```

5. Do the REST API (POST) endpoints `/quizzes/:quizId/questions` to create many new questions in quizId

POST

https://localhost:3443/quizzes/65ee9f0c9eb6744aa7fbc604/questions
